L'objectif global de ce travail pratique est de charger progressivement le dataset SBLP dans Neo4j.

Le dataset est fournis sous la forme d'un fichier JSONL. Chaque ligne correspond à un article. Le but est de transformer ces données en graphe Neo4j avec:

- des noeuds "article"
- des noeuds "author"
- des relations "authored" entre auteurs et articles
- des relations "cites" entre articles

Chargement des données avec le loader Java

Le chargement est fait par la classe [Loader.java](#). Cette classe lit les données depuis une URL, extrait les articles, auteurs et citations puis les insère dans Neo4j par lots.

Configuration par variables d'environnement

Le loader ne contient pas de config fixe. Les paramètres importants sont lus depuis les variables d'environnement.

```
String jsonUrl = getenv("JSON_FILE_URL", "http://vmrum.isc.heia-fr.ch/files/test.jsonl");
int maxArticles = Integer.parseInt(getenv("MAX_NODES", "10000"));
int batchSize = Integer.parseInt(getenv("BATCH_SIZE", "1000"));

String neo4jIp = getenv("NEO4J_IP", "localhost");
String neo4jUser = getenv("NEO4J_USER", "neo4j");
String neo4jPassword = getenv("NEO4J_PASSWORD", "test");
```

Configuration par variables d'environnement

Comme décrit dans l'Exemple.java qui a été fourni, le loader se connecte à Neo4j avec le driver officiel Neo4j java et le port 7687 qui est le port Bolt de Neo4j qui est utilisé par l'app Java pour envoyer des requêtes Cypher.

```
Driver driver = GraphDatabase.driver(
    "bolt://" + neo4jIp + ":7687",
    AuthTokens.basic(neo4jUser, neo4jPassword)
);
```

Création des contraintes

Avant d'insérer les données, le programme crée deux contraintes permettant d'éviter de créer plusieurs fois le même article ou le même auteur.

```
private static void createConstraints(Session session) {
    session.writeTransaction(tx -> {
        tx.run(
            "CREATE CONSTRAINT article_id IF NOT EXISTS " +
            "FOR (a:Article) " +
            "REQUIRE a._id IS UNIQUE"
        );

        tx.run(
            "CREATE CONSTRAINT author_id IF NOT EXISTS " +
            "FOR (a:Author) " +
            "REQUIRE a._id IS UNIQUE"
        );

        return null;
    });
}
```

Lecture du fichier JSONL en streaming

Le fichier est lu ligne par ligne depuis l'URL configurée. Chaque ligne est ensuite convertie en objet JSON.

```
URL url = new URL(jsonUrl);
BufferedReader br = new BufferedReader(new InputStreamReader(url.openStream()));

String line;

while ((line = br.readLine()) != null && articleCount < maxArticles) {
    JsonNode json = mapper.readTree(line);
}
```

Extraction des articles

Pour chaque ligne, le loader récupère l'identifiant et le titre de l'article. Si l'article possède un identifiant valide, il est ajouté au batch. L'identifiant JSON est utilisé comme priorité `_id` dans Neo4j.

```
String articleId = getText(json, "id");
String title = getText(json, "title");

if (articleId == null || articleId.trim().isEmpty()) {
    continue;
}

Map<String, Object> articleMap = new HashMap<String, Object>();
articleMap.put("id", articleId);
articleMap.put("title", title == null ? "" : title);
articleBatch.add(articleMap);
```

Extraction des auteurs

Les auteurs sont lus depuis le champ `authors`. Pour chaque auteur, le programme récupère son identifiant et son nom.

```
JsonNode authors = json.get("authors");
if (authors != null && authors.isArray()) {
    for (JsonNode author : authors) {
        String authorId = getText(author, "id");
        String authorName = getText(author, "name");

        if (authorId == null || authorId.trim().isEmpty()) {
            continue;
        }

        uniqueAuthors.add(authorId);

        Map<String, Object> authorMap = new HashMap<String, Object>();
        authorMap.put("id", authorId);
        authorMap.put("name", authorName == null ? "" : authorName);
        authorBatch.add(authorMap);

        Map<String, Object> authoredMap = new HashMap<String, Object>();
        authoredMap.put("authorId", authorId);
        authoredMap.put("articleId", articleId);
        authoredBatch.add(authoredMap);
    }
}
```

Extraction des citations

Les citations quant à elle sont lues depuis le champ `references`. Pour chaque citation le loader prépare une relation entre l'article courant et l'article cité. Même si l'article cité n'a pas encore été lu dans le fichier, il peut

déjà être créé dans Neo4j avec son `_id`. Son titre sera complété plus tard si l'article apparaît dans le dataset.

```
JsonNode references = json.get("references");
if (references != null && references.isArray()) {
    for (JsonNode ref : references) {
        if (ref == null || !ref.isTextual()) {
            continue;
        }

        String citedId = ref.asText();

        Map<String, Object> citationMap = new HashMap<String, Object>();
        citationMap.put("articleId", articleId);
        citationMap.put("citedId", citedId);
        citationBatch.add(citationMap);
    }
}
```

insertion par batchs

Pour éviter d'envoyer une requête par ligne, les données sont insérées par batch. la taille du batch est configurable avec `BATCH_SIZE`.

```
if (articleCount % batchSize == 0) {
    insertBatch(session, articleBatch, authorBatch, authoredBatch, citationBatch);

    long elapsed = (System.currentTimeMillis() - start) / 1000;

    System.out.println(
        "PROGRESS articles=" + articleCount +
        " authors=" + uniqueAuthors.size() +
        " totalNodes=" + (articleCount + uniqueAuthors.size()) +
        " elapsedSeconds=" + elapsed
    );

    articleBatch.clear();
    authorBatch.clear();
    authoredBatch.clear();
    citationBatch.clear();
}
```

à chaque batch, les articles, auteurs, relation authored et cites sont insérés. UNWIND permet d'envoyer une liste de données à Neo4j et de les traiter côté db.

```
private static void insertBatch(
    Session session,
    final List<Map<String, Object>> articles,
    final List<Map<String, Object>> authors,
```

```

        final List<Map<String, Object>> authored,
        final List<Map<String, Object>> citations
    ) {
        session.writeTransaction(tx -> {
            tx.run(
                "UNWIND $articles AS row " +
                "MERGE (a:Article {_id: row.id}) " +
                "SET a.title = row.title",
                parameters("articles", articles)
            );

            tx.run(
                "UNWIND $authors AS row " +
                "MERGE (a:Author {_id: row.id}) " +
                "SET a.name = row.name",
                parameters("authors", authors)
            );

            tx.run(
                "UNWIND $authored AS row " +
                "MATCH (author:Author {_id: row.authorId}) " +
                "MATCH (article:Article {_id: row.articleId}) " +
                "MERGE (author)-[:AUTHORED]->(article)",
                parameters("authored", authored)
            );

            tx.run(
                "UNWIND $citations AS row " +
                "MATCH (article:Article {_id: row.articleId}) " +
                "MERGE (cited:Article {_id: row.citedId}) " +
                "MERGE (article)-[:CITES]->(cited)",
                parameters("citations", citations)
            );

            return null;
        });
    }

```

Déploiement local avec Docker Compose

Pour tester localement, un docker compose est utiliser avec deux conteneurs, un db contenant Neo4j et un app contenant le loader java. Celui-ci a en grande partie été mis à disposition dans le repo de base.

```

services:
  db:

Premier résultat local

Avec la configuration suivante:

```

- JSON_FILE_URL=http://vmrum.isc.heia-fr.ch/files/DBLP-Citation-network-V18.jsonl
- MAX_NODES=10000
- BATCH_SIZE=1000

```

Avant le test, la base local Neo4j a été supprimée afin de repartir à vide:

```
docker compose down
Remove-Item -Recurse -Force .\neo4j_mount
docker compose up
```

Le loader a ensuite lu le fichier JSONL depuis l'url et a inséré les data dans neo4j par batch de 1000 acticles. Les logs sont les suivants:

```

Auteurs distincts : 28 309
Total de noeuds : 38 309
Durée : 58 secondes
```

Quelques vérifications directement via l'interface de Neo4j ont été fait afin de voir le bon chargement des datas.

The screenshot shows the Neo4j Browser interface in a web browser. The address bar shows `localhost:7474/browser/`. The main area displays a Cypher query: `neo4j$ MATCH (a:Article) RETURN a._id, a.title LIMIT 10;`. Below the query, a table of results is shown with columns `a._id` and `a.title`. The table contains 10 rows of data. A status message at the bottom indicates: "Started streaming 10 records after 8 ms and completed after 12 ms."

Déploiement sur Kubernetes

Le déploiement final a été réalisé sur le cluster Kubernetes de l'école, dans le namespace **hertl-adv-daba-26**. L'objectif du déploiement est d'avoir deux composants séparés. Un pod Neo4j qui contient la base de

données et conserve les données chargées et un job kubernetes neo4j-loader qui lance le programme java pour le chargement.

Contrairement au déloiement local avec docker compose, le loader ne se connecte pas à neo4j avec une IP fixe. Dans kubernetes, je créer un service nommé neo4j qui permettra au pod du loader de résoudre automatiquement l'adresse du pod Neo4j via le dns interne de kubernetes.

```
- name: NEO4J_IP
  value: "neo4j"
```

Image docker du loader

Pour que Kubernetes puisse lancer le loader, l'image Docker ne peut pas rester uniquement sur la machine local. Elle doit être disponible dans un registry docker. l'image local a donc été taguée puis poussée sur Docker Hub:

```
docker tag neo4jtp:latest nicolasdockerhertling/neo4jtp:latest
docker push nicolasdockerhertling/neo4jtp:latest
```

L'image est utilisée après dans le job kubernetes:

```
image: nicolasdockerhertling/neo4jtp:latest
```

Fichiers Kubernetes

Les fichiers Kubernetes ont été placés dans le dossier [k8s/](#).

```
k8s/neo4j-pvc.yaml
k8s/neo4j-deployment.yaml
k8s/neo4j-service.yaml
k8s/loader-job.yaml
```

Le fichier [neo4j-pvc.yaml](#) créer un volume persistant pur conserver les data Neo4j.

Le fichier [neo4j-deployment.yaml](#) lance le pod Neo4j avec l'image officiel.

[neo4j-service.yaml](#) expose Neo4j à l'intérieur du namespace Kubernetes notamment sur le port bolt 7687.

Finalement, le fichier [loader-job.yaml](#) lance le programme java de chargement. Les données sont chargées via l'url "http://vmrum.isc.heia-fr.ch/files/DBLP-Citation-network-V18.jsonl", avec les paramètres suivants:

```
- name: JSON_FILE_URL
  value: "http://vmrum.isc.heia-fr.ch/files/DBLP-Citation-network-V18.jsonl"
```

```
- name: MAX_NODES
  value: "1000000"
- name: BATCH_SIZE
  value: "1000"
- name: NEO4J_IP
  value: "neo4j"
- name: NEO4J_USER
  value: "neo4j"
- name: NEO4J_PASSWORD
  value: "test"
```

Déploiement de Neo4j

Les ressources Neo4j sont créées avec les commande suivantes:

```
kubectl apply -f k8s/neo4j-pvc.yaml -n hertl-adv-daba-26
kubectl apply -f k8s/neo4j-deployment.yaml -n hertl-adv-daba-26
kubectl apply -f k8s/neo4j-service.yaml -n hertl-adv-daba-26
```

Après le déploiement, on peut vérifier relativement facilement si le bod Neo4j a bien démarré:

```
kubectl get pods -n hertl-adv-daba-26
```

NAME	READY	STATUS	RESTARTS	AGE
neo4j-6b6c5dc9f4-92dk7	1/1	Running	0	13s

Déploiement du Loader

Le loder est déployé sous fome de Job. Ce qui signifie qu'il s'exécute une fois, charge les données et se termine.

Pour lancer le job:

```
kubectl apply -f k8s/loader-job.yaml -n hertl-adv-daba-26
```

Voir logs:

```
kubectl logs job/neo4j-loader -n hertl-adv-daba-26
```

suvire logs:

```
kubectl logs -f job/neo4j-loader -n hertl-adv-daba-26
```

Redémarrage d'un test

Quand on modifie le loader-job.yaml, Kubernetes ne met pas automatiquement à jour un job existant. Il faut supprimer l'ancien job et le recréer:

```
kubectl delete job neo4j-loader -n hertl-adv-daba-26  
kubectl apply -f k8s/loader-job.yaml -n hertl-adv-daba-26
```

Pour remettre d'une base complètement vide, il faut aussi supprimer le déploiement neo4j et son volume persistant:

```
kubectl delete job neo4j-loader -n hertl-adv-daba-26  
kubectl delete deployment neo4j -n hertl-adv-daba-26  
kubectl delete pvc neo4j-data -n hertl-adv-daba-26
```

Et recréer:

```
kubectl apply -f k8s/neo4j-pvc.yaml -n hertl-adv-daba-26  
kubectl apply -f k8s/neo4j-deployment.yaml -n hertl-adv-daba-26  
kubectl apply -f k8s/neo4j-service.yaml -n hertl-adv-daba-26
```

et relancer le loader:

```
kubectl apply -f k8s/loader-job.yaml -n hertl-adv-daba-26
```

Streaming et batchs

Dans la consigne, on demande que les données soient streamées depuis l'URL fournie. Ce qui ne signifie pas qu'il faut insérer un article à la fois dans Neo4j. Afin de permettre les deux, le fichier JSONL est lu en streaming, ligne par ligne :

```
URL url = new URL(jsonUrl);
BufferedReader br = new BufferedReader(new InputStreamReader(url.openStream()));

String line;

while ((line = br.readLine()) != null && articleCount < maxArticles) {
    JsonNode json = mapper.readTree(line);
}
```

Le fichier complet n'est donc jamais copié dans le conteneur et n'est jamais chargé entièrement en mémoire.

Le paramètre **BATCH_SIZE** sert uniquement à grouper les insertions dans Neo4j. Avec un BATCH_SIZE de 1000, le programme lit tjrs les données en streaming, mais insère les données dans Neo4j tous les 1000 articles, permettant de diminuer fortement le nbre de transactions envoyées à la base et améliorant les performances.

Un essai avec BATCH_SIZE=1 a montré que cette configuration est beaucoup plus lente, car elle crée une transaction par article. Pour les tests significatifs, j'ai choisi d'utiliser BATCH_SIZE=1000.

Résultat Kubernetes avec 10 000 articles

un premier test kubernetes a été réalisé avec la configuration suivante:

```
- name: MAX_NODES
  value: "10000"
- name: BATCH_SIZE
  value: "1000"

DURATION_SECONDS=3910
```

Ce test a donc chargé:

- Articles complets lus : 1 000 000
- Auteurs distincts : 1 242 546
- Total articles + auteurs : 2 242 546
- Durée : 3 910 secondes, soit environ 65 minutes
- Débit observé : 2 242 546 / 3 910 = environ 573 noeuds par secondes

On peut voir que le débit est plus faible que pour le test à 100 000 articles, probablement dû au fait que la base devient beaucoup plus grande, ce qui rend les opérations MERGE plus coûteuses, notamment sur les articles cités et les relations.

Vérification des données dans Neo4j

Une vérification des données a été faite directement dans le pod neo4j avec cypher-shell:

```
kubectl get pods -n hertl-adv-daba-26

Nombre de noeuds par label:

```
MATCH (n) RETURN labels(n), count(n);
+-----+
| labels(n) | count(n) |
+-----+
| ["Article"] | 3108245 |
| ["Author"] | 1242546 |
+-----+
```

Il y a plus d'articles est supérieur au nombre d'articles complets lus depuis le fichiers JSONL. ce qui est normal car les articles cités sont également créés lors de l'insertion des relation CITES, même si leur ligne complète n'a pas encore été lue.

Nombre de relation par type:

```
MATCH ()-[r]->() RETURN type(r), count(r);
+-----+
| type(r) | count(r) |
+-----+
| "CITES" | 10945109 |
| "AUTHORED" | 3077492 |
+-----+
```

Vérification de quelques articles:

```
MATCH (a:Article) RETURN a._id, a.title LIMIT 10;

| "5390877920f70186a0d2ce7f" | "Top-Down Construction of 3-D Mechanical Object Shapes from Engineering Drawings" |
| "5390877920f70186a0d2d85b" | "MH: A Multifarious User Agent." |
| "5390877920f70186a0d2e433" | "Characterizing an Optimal Input in Perturbed Convex Programming: Corrigendum" |
```

Quelques auteurs:

```
MATCH (a:Author) RETURN a._id, a.name LIMIT 10;

| "62aad3b2d9f2040d085dc9f9" | "Hiroshi Yoshiura" |
| "5608ec4a45cedb3396db2920" | "Kikuo Fujimura" |
| "548a62d3dabfae8a11fb49e2" | "Tosiyasu L. Kunii" |
```

En raison du temps de traitement, je n'ai pas testé avec plus de 10 millions d'articles, mais le principe reste le même.
